

Explore Storefront Next Code Locally

Explore Storefront Next locally without setting up a B2C Commerce instance or using Business Manager. This procedure uses the default configuration values for the demo instance and isn't for creating your own storefront. Generate the storefront code via the command line using the predefined B2C Commerce demo instance.

Contents

[Prerequisites](#)[Steps](#)[Next Steps](#)

Prerequisites

- Node Package Manager (pnpm) version 10.28 or later. See [Installation](#) on the pnpm site.
- Node.js version 24.13.0 or later. See [Download Node.js](#) on the Node.js site.
- The Storefront Next dependencies are specified in `package.json`. You install them in this quick start by using the `pnpm install` command.

Steps

1. Create a folder for all your storefront projects and navigate to it.
2. Discover the Storefront Next CLI commands available by typing this command.

```
1 pnpm dlx @salesforce/storefront-next-dev
```

To learn more about each subcommand, type the `-h` or `--help` argument after the command.

3. Create a Storefront Next project by typing this command in the new folder, and then answer the questions to configure your storefront.

```
1 pnpm dlx @salesforce/storefront-next-dev
```

- a. Provide a name for your storefront. For example, `my-demo-storefront`.
- b. For the Storefront Next UI template, select `Salesforce B2C Commerce Retail Storefront`.

values reference the demo B2C Commerce instance.

**Tip**

To use your own B2C Commerce instance, use Business Manager to create your storefront and related resources. See [Create a Storefront in Business Manager](#) or [Create Storefront Next in Business Manager with a GitHub Repository](#). To create a SLAS client ID via the CLI, see [Storefront Next](#) in the B2C DX documentation on GitHub.

The command creates a project folder under the current directory with your storefront name, and clones the template into it from the [storefront-next-template](#) GitHub repository.

4. Open the project folder in an IDE.
5. (Optional) Verify your configuration in the generated `.env` file. The default values connect to a demo B2C Commerce instance.
6. In a terminal window, go to the storefront folder.

```
1 cd {project-folder}
```

7. Install Storefront Next project dependencies that are specified in `package.json`.

```
1 pnpm install
```

8. Build the storefront.

```
1 pnpm run build
```

9. Run the development server.

```
1 pnpm run dev
```

10. Open the development server URL shown in the output to view the storefront in the browser. For example, the URL with the default port is `http://localhost:5173`.
