

Configure Address Autocomplete for Storefront Next

Address autocomplete streamlines checkout in Storefront Next for B2C Commerce. During checkout, shoppers can enter the first three characters of their shipping or billing address to instantly receive Google-powered recommendations. When a shopper selects an address from the list of recommendations, Google completes the remaining fields.

The screenshot shows the 'Checkout' page in Storefront Next. At the top, there are payment options: 'Express Checkout' with buttons for 'Giv', 'Apple Pay', 'PayPal', 'venmo', and 'amazon pay'. Below this is a 'Contact Information' section with fields for email and phone. The 'Shipping Address' section is highlighted with a red box. It contains fields for 'First Name*' (Henry), 'Last Name*' (Lewis), and 'Address Line 1*'. Below the address field, a 'SUGGESTED' dropdown menu is open, showing a list of address recommendations: '4156 Kevin Street, Dublin, CA, USA', '4150 Byrne Street, Dublin, CA, USA', '41500 Blackow Road, Fremont, CA, USA', '415 Sweetwater Drive, San Leandro, CA, USA', and '4150 Toyon Way, Castro Valley, CA, USA'. To the right of the shipping address section is an 'Order Summary' table showing 'Subtotal: \$135.00', 'Shipping: TBD', 'Tax: TBD', and 'Total: \$135.00'. Below the summary is a 'Do you have a promo code?' section with a 'Promo code...' input field and an 'Apply' button. At the bottom right, there is a product preview for 'Modern Dress Shirt' with a 'color: blue' and 'size: 15L' selection, a price of '\$135.00', and a quantity of 'Qty: 1'.

If you want to test address autocomplete in a sandbox, staging, or development instance, set up your own Google Cloud Platform (GCP) project and billing, and your own API Key for the Google Maps Platform. Then, input the API Key as a new `PUBLIC__app__features__googleCloudAPI__apiKey` environment variable in your Managed Runtime (MRT) project. See [Getting started with Google Maps Platform](#) and [Environment Variables](#).

1. Set up Storefront Next.

To create a storefront with a GitHub repository, see [Create a Storefront in Business Manager with a GitHub Repository](#).

To create a storefront with local code, see [Create a Storefront in Business Manager with Local Code](#).

2. (Required only for production instances) To allow the Google API key to become available in Storefront Next, update the hostnames in your alias file.

a. In Business Manager, click App Launcher, and then select **Merchant Tools | Site | SEO | Aliases**.

b. Specify your hostnames in the alias file and save your changes.
