

Email Verification for Storefront Next

Storefront Next supports email verification to confirm shopper identity using a one-time passcode (OTP). A Business Manager site preference controls email verification. When enabled, the site preference activates these features.

- **Passwordless registration and login as default** – Shoppers create accounts and log in using an OTP instead of a password.
- **Email verification** – Shoppers verify their email address during registration and on the Account Details page.
- **Email update support** – Shoppers have the option to change their email address in account details. If they don't have a password, OTP-based identity confirmation is required before the system applies the change. OTP verification isn't required for shoppers who do have a password.

Prerequisites

- Configure a Shopper Login and API Access Service (SLAS) private client with passwordless login enabled. For instructions, see [Configure a SLAS Private Client](#) in the *B2C Commerce API Developer Guide*.
- In `config.server.ts`, set `commerce.api.privateKeyEnabled` to `true`. If `false`, passwordless login is disabled at run time.
- Enable **Enable Loginid Updates for SCAPI**. With this setting, shoppers can update their login email via

Preferences, turn on **Enable Email Verification**. This preference enables passwordless registration, post-registration email verification, and the email change flow in account details.

Note

Changes to site preferences can take up to 5 minutes to reflect on a deployed storefront.

Configure Settings

To control OTP settings, update `auth` and `features.otpRequest` in `config.server.ts`.

```
</> | [icon]
1  auth: {
2    otpLength: 6,
3  },
4  features: {
5    otpRequest: {
6      mode: 'email',
7    },
8  }
```

- `otpLength`: The length of the OTP code. Valid values are `6` or `8`. Defaults to `6`. Make sure that this value matches the OTP length configured in your SLAS client. See [Configure a SLAS Private Client](#) in the *B2C Commerce API Developer Guide*.
- `mode`: The mode used to deliver the OTP to the shopper (`email` or `callback`). Defaults to `email`. The `callback` mode doesn't support email verification.

To override configuration options, use Managed Runtime (MRT) environment variables with the `PUBLIC__` prefix.

OTP Delivery with Email (SLAS Native Email Service)

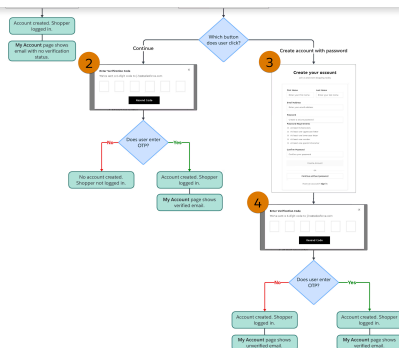

Passwordless login supports both email and callback modes, but only the email mode supports email verification. When `mode` is set to `email`, SLAS sends the OTP directly to the shopper's email without third-party integration. This mode doesn't require a callback URI.

1. Configure SLAS for passwordless login with email. See [Passwordless Login with Email](#) in the *B2C Commerce API Developer Guide*.
2. In `config.server.ts`, set the OTP mode to `email`.

```
1 features: {  
2   otpRequest: {  
3     mode: 'email',  
4   },  
5 }
```

Registration

This diagram shows the complete registration flow. When **Enable Email Verification** is turned off, accounts are created without verification. When it's turned on, shoppers can use passwordless mode (the default) or create a password to register. The numbered callouts in the diagram correspond to the steps described in each registration method (Passwordless and Password-Based with Email Verification).

Passwordless Registration

If a site has **Enable Email Verification** turned on, the registration page defaults to passwordless mode. To create an account, shoppers enter their name and email and complete OTP verification.

1. The shopper submits their name and email (1).
2. The storefront calls the SLAS passwordless login endpoint, which creates the account and sends an OTP to the shopper's email.
3. The shopper enters the OTP in the verification modal to complete registration (2).

Login

Passwordless Login

If a site has **Enable Email Verification** turned on, the login page defaults to passwordless mode. To log in, shoppers enter their email and complete OTP verification.

If **Enable Email Verification** is turned off, the login page supports password (1) or social login (2), if configured.

If **Enable Email Verification** is turned on, the login page supports passwordless (3), password (4), and social login (5), if configured. Both login pages in this

Account Details

Email Verification Badge

If a site uses email verification, the Account Details page shows a **Verified** or **Unverified** badge next to the shopper's email address.

The top screenshot shows the 'Email Address' section with the text 'Manage your email address'. Below it, the email address 'example@example.com' is displayed with a 'Change email' button to its right.

The bottom screenshot shows the 'Email Address' section with the text 'Manage your email address'. Below it, the email address 'example@example.com' is displayed with a 'Verify email' button and a 'Change email' button to its right.

Change Email

The Account Details page only shows the **Change Email** button if the site has email verification turned on. The identity confirmation method depends on whether the shopper has a password.

- **Accounts without a password** – The shopper verifies their identity with an OTP sent to their current email address before they can change their email.
- **Accounts with a password** – The shopper verifies their identity with their current password.

1. The shopper clicks **Change Email**.
2. The shopper confirms their identity using their password.
3. The shopper enters their new email address and submits the change.

Password Card

For passwordless accounts (accounts without a password), the password card shows a **Reset Password** button instead of **Change Password**, so shoppers can set a password if they choose.

The screenshot shows the 'Password & Security' section with the text 'Manage your password and security settings'. Below it, the text 'Password' is displayed with 'Not provided' underneath it. To the right of this text is a 'Reset password' button.

Best Practices for Email Verification

- Implement rate limiting to prevent abuse of password reset. For

[api/guide/cdn-rate-limiting-rules.html](#)).

- Use robust security measures to protect shopper accounts. For example, if you use a third-party content delivery network (CDN) such as Cloudflare, [Block requests by Threat Score] (<https://developers.cloudflare.com/waf/custom-rules/use-cases/block-ip-reputation/>).
- Track shopper usage of authentication options and diagnose issues efficiently. For example, use [Log Center] (https://help.salesforce.com/s/articleView?id=cc.b2c__log__center.htm\&type=5) to access logs from Managed Runtime (MRT) and your B2C Commerce instance.

Troubleshoot Email Verification

For common troubleshooting scenarios, see [Troubleshoot Passwordless Login] (<https://developer.salesforce.com/docs/commerce/commerce-api/guide/slas-passwordless-login-troubleshoot.html>) in the *B2C Commerce API Developer Guide*.
