

Troubleshooting Tips for Storefront Next

Before following the targeted advice in this guide, try these general troubleshooting steps.

- Double-check that you're running a supported version of Node before starting your local development server.
- Confirm that your development server is still running and the port hasn't been taken over by another process.
- After saving a code change, the browser updates automatically via Hot Module Replacement (HMR). If the change doesn't appear, check the terminal for build errors before forcing a reload.
- Look for errors in both the browser console and in the terminal.
- Look for network error responses using your browser's developer tools. (In Chrome's DevTools, go to the **Network** tab.)
- To help identify syntax errors and typos, run a code formatter and a linter. The command for running lint is `pnpm lint` for checking and `pnpm lint:fix` for auto-fixing lint issues. Configuration files are provided for both [Prettier](#) (code formatter) and [ESLint](#) (linter) in the Storefront Next app.
- To catch TypeScript errors that don't show up at run time, run `pnpm typecheck`.
- To see SCAPI requests and internal state changes, run `SFCC_LOG_LEVEL=debug pnpm dev` to increase log verbosity.
- Check your computer's antivirus and firewall settings for anything that is preventing your code from running or blocking network requests.
- To identify and analyze performance issues, use the Profiler in Chrome's DevTools. For more information, see this guide from Google: [Analyze Runtime Performance](#). You can also install the React Developer Tools extension for Chrome to get another Profiler tab where you can see similar info but at the component level.
